

Gaia DR3, NGC 6544

Rank the globular clusters in the table by the ease of separating the cluster members from the field stars, using the [Gaia DR3](#).

Here is the first example: [NGC 6544](#). The database of each globular cluster can be explored [here](#).

Variables used: source_id, ra, dec, parallax, pmra, pmdec, bp_rp, mh_gspphot, radial_velocity, phot_g_mean_mag.

Set working directory.

```
setwd("~/Desktop/AstroPhysics/Gaia-L4")

ngc_6544 <- read.csv("~/Desktop/AstroPhysics/Gaia-L4/16570653395710-
result.csv")

Model 12

- Use `lm()` to regress `ra` on `dec` and save the regression as `model_12`.

```
model_12 <- lm(ra ~ dec, data = fsr_1758)
```

- Regression results from the first model using `summary()`.

An increase of one unit of dec is associated with an additional 0.59648 unit increase in ra. This relationship is statistically significant at < 0.001 .

```
summary(model_12)
